Introduction

VideoMorph is a multi-platform application, dedicated to the conversion of video formats. There are many applications for these purposes, but all of them have many options that can be complicated for new users, so we decided to focus on the main task, facilitating the conversion of your audiovisual materials in an intuitive and easy way. **VideoMorph** was developed with Python programming language, Ffmpeg multimedia processing library and PyQt for the Graphical User Interface. With **VideoMorph** is possible to convert the most used video formats at present, such as **MP4, AVI, DVD, VCD, MPG, FLV, WEBM**, as well as extract the audio in **MP3** format, among others.

Tools Bar

It contains the elements:

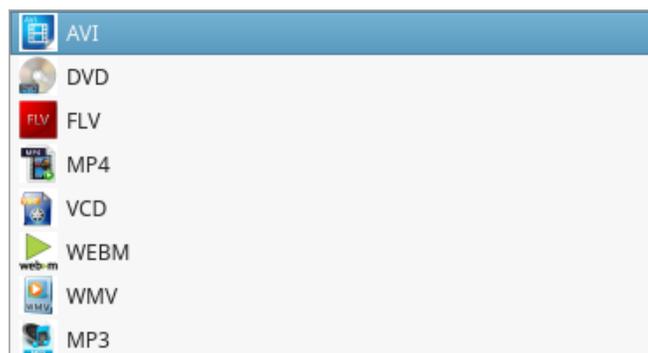

- **Add Files:** Opens a dialog to select the video files you want to convert. Once selected, they are placed in the **List of Conversion Tasks**

List of Conversion Tasks				
	File Name	Duration	Target Quality	Progress
1	 Dad.mpg	02m:01s	WMV Generic	To Convert

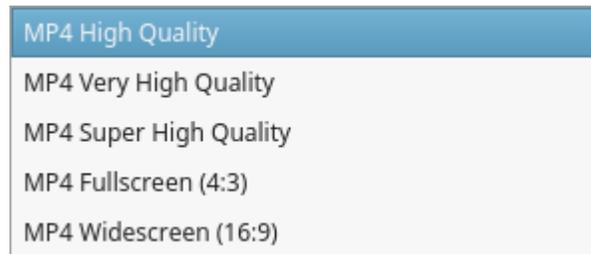

- **Clear List:** Deletes the entire List of Conversion Tasks
- **Remove File:** Deletes an individual file selected from the files in the List of Conversion Tasks.

Main Window's Options

- **Convert to:** Select the output video format, that is, the format you want to give to the files arranged in the List of Conversion Tasks, from list of available video formats in the **Convert to** drop-down list

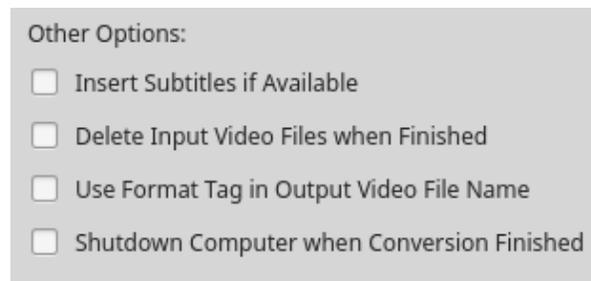

- **Target Quality:** Select the quality you want to use in the conversion process from the **Target Quality** drop-down list

- **Output Directory:** Selected the folder where the converted video files will be saved

- **Other Options:** Several options appear that may be useful:

- ✓ **Insert Subtitles if Available:** This option is very interesting, because it allows us to embed the subtitle inside the video you are converting, as long as you have the subtitle file in **SRT** format
- ✓ **Delete Input Video Files when Finished:** This allows you to delete the original video file when the conversion is finished, this way you will not have two identical video files, saving disk space
- ✓ **Use Format Tag in Output Video File Name:** This allows us to include, in the name of the converted file, a format identification tag. It is useful when you want to do several conversions to several formats of the same video file
- ✓ **Shutdown Computer when Conversion Finished:** It allows to shutdown the computer once the conversion process finished. It is useful when the List of Conversion Tasks is large and you don't want to wait for the conclusion of the process to shutdown the computer.

Main Menu

The Main Menu of the application is composed of 4 elements: File, Edit, Convert and Help

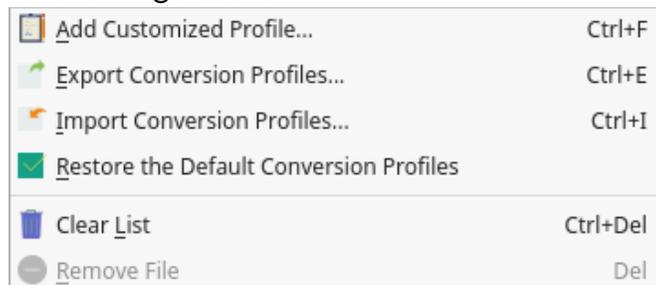

File Edit Conversion Help

- **File Menu:** Allows you to perform the following actions:

- a) Add files to the Conversion Task List
- b) Add a folder to convert all the video files contained in it
- c) Exiting the Application.

- **Edit Menu:** Includes the following actions:

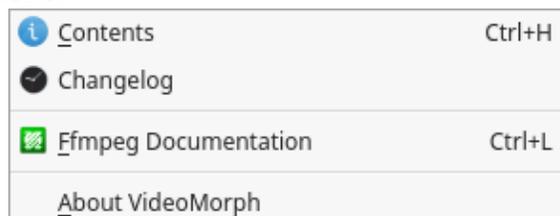

- a) This option is for users who master the conversion library, create their own conversion profiles
- b) Export custom conversion profiles
- c) Import custom conversion profiles
- d) Resets the default conversion profiles of the application
- e) Delete the selected video file from the List of Conversion Tasks
- f) Delete all video files from the List of Conversion Tasks.

- **Conversion Menu:** Allows you to perform the following actions:

- a) Starts the conversion process
- b) Stops the conversion of the video file in process
- c) Stops all processing of the videos included in the List of Conversion Tasks.

- **Help Menu:** Includes options:

- a) Shows the contents of this manual

- b) View the application changelog
- c) Open the Online Documentation page for Ffmpeg library
- d) Display the About dialog...
